Acknowledgments

Special appreciation is due to the field crews who collected the boat census data that underlie this study's analyses. Captain John Sturm, John Sturm Jr, Fishin Frank Hommema Sr, Fishin Frank Hommema Jr, and Mike Fitzcharles manned the two research vessels and worked from shore when appropriate, visiting boat locations—including residential canal systems, navigable creeks, rivers, marinas, and boatyards—throughout Charlotte County. Carefully and efficiently navigating the waterways and operating the data collection instruments, they captured a detailed snapshot of the Charlotte County boat population. They maintained data integrity and equipment health throughout the process, despite the exigencies of weather, tides, and tight schedules. Jim Joseph (Fantasea Scuba) provided invaluable coordination and logistical support.

Mel Staudmeyer and Gerald Meckenberg, members of the Charlotte County Marine Advisory Committee, reviewed channel planning maps and provided guidance to ensure channels constructed for the restriction analyses represented those actually used by boaters. The Marine Task Force (staff from Charlotte County and City of Punta Gorda) contributed input through the entire project.

Jamie Cohlmeier (Coastal Engineering Consultants, Naples) created a bathymetry dataset for all navigable waterways in Charlotte County. This included obtaining existing data, managing collection of new soundings, and ensuring quality control of the point depth data used for channel synthesis.

1. Introduction

Charlotte County faces a daunting planning dilemma: how to balance the growth of its boating population with conservation and management of its estuarine resource, including Charlotte Harbor, bay waters behind the coastal barrier islands, tributary rivers and streams, and canal systems accessible from these waters. This project is a collaborative effort by the Charlotte County Natural Resources Division, the West Coast Inland Navigation District, and the University of Florida Sea Grant Program to apply science and technology to the region's waterway management issues.

The waters and shore ecosystems of Charlotte County are attractive, unique, and varied—but vulnerable to pressures from boating and from expanding commercial and residential developments that fringe the coastline. The region is a mecca for boating enthusiasts; increased boat traffic and upland development create problems that are manifested in declining water quality and stressed habitat conditions, such as boat wakes that wash away soil and sand supporting mangrove roots, boat contaminants that accumulate due to low tidal exchange within enclosed canal systems, or prop scarring of sea grass beds.

The quandary that confronts private citizen users, planners, and elected officials is how to sustain and protect this coastal ecosystem without isolating people from nature. The Florida Sea Grant approach is to devise and use methods that allow for the simultaneous use and protection of coastal waters, while maintaining the economic vitality of coastal communities. This approach is integral to the Charlotte County Regional Waterway Management System project, which evaluates the human ecosystem (boat user) and waterway system (environment) jointly, concurrently, and spatially.

The report focuses on the technical aspects of waterway management and provides a planning tool and decision options to stabilize channel conditions in order to avoid further deterioration of bay resources. A detailed, comparative analysis of water depth and boat draft relations provides a comprehensive overview of channel conditions and the geographic distribution and severity of waterway restrictions. Two planning options are illustrated: (1) normal low tide conditions and (2) below normal (winter Cold Front) conditions. Data for a third option is presented: (3) adjusting waterway maintenance standards to the variable draft capability of restricted boats. The approach presented in the report ensures a rational and objective method of waterway management.

In situations where dredging is selected as an appropriate management option, the prescribed dredge depth and width will depend on a number of factors, including regulatory and historical precedents, potential environmental impacts, draft characteristics of the present boat population, and cost. Designated controlling depths that have been established via permitting from the Florida Department of Environmental Protection (FDEP) may set practical limits to upstream dredge projects. A central tenet of the Florida Sea Grant approach is that maintained, signed channels (1) discourage

resource depletion by encouraging boaters to stay within the channels and away from environmentally sensitive shoal areas and (2) promote safe navigation.

Cost, including spoil disposal, is another factor that influences the depth-to-dredge decision. Some restricted waterways are secondary access channels, for which there is a clear public need to fully subsidize the maintenance of the waterway. Other waterways are residential canal systems where the maintenance cost should be borne by local citizen users. The Geographic Information System developed for the project provides the necessary information to identify where public/private partnerships may be required to cost-share local waterway restoration or improvement.

Estimated dredging requirements are provided for “trafficsheds”¹ and secondary channels that contain waterway restrictions (Appendix C). The 20-foot wide improvement footprint used in the study conforms with the WCIND “surgical” approach to maintenance dredging adopted for regional waterway management in southwest Florida in order to minimize environmental impacts to bay resources.

2. Background

The Regional Waterway Management System for Charlotte County provides the scientific base and information necessary to meet the waterway management needs of waterfront neighborhoods on tidal waters throughout the county. The study area includes approximately 350 miles of navigable waterways, 10,613 boats, and 31,673 moorings (boat locations, whether occupied or vacant when surveyed). Information is presented on boats, channels, and potential dredging required to provide boats with waterway access from berths to secondary channels and, ultimately, to deep, open water—the point at which a vessel is no longer restricted to a channel². A detailed analysis delineates and quantifies, at 0.5-foot resolution, levels of boat accessibility to open bay waters and the location and extent of channel depth restrictions.

The methodology and objectives of the Charlotte County Project stem from a pilot study (Antonini and Box, 1996) conducted in selected areas of Manatee and Sarasota counties by Florida Sea Grant (FSG) and the West Coast Inland Navigation District (WCIND). The pilot study, designed for southwest Florida waterways, was a test application of a management system that is consistent with municipal, county, Florida Department of Environmental Protection (FDEP), and WCIND goals of facilitating safe boating and reducing boating impacts on natural resources. The design criteria are: (a) fit channel maintenance to boat draft needs; (b) minimize impacts on bay habitats; (c) prioritize and evaluate management alternatives on a regional scale; and (d) identify

¹The term *trafficshed* is used to define an area that contains a concentration of boats that use a common channel, exclusive to the trafficshed, to gain access to secondary access channels and, ultimately, to deep, open water.

²For this report, *deep, open water*—defined as a function of vessel draft—begins at that location in the transit of a vessel, from its berth, beyond which the vessel is no longer restricted to a channel because of environmental or depth limitations. The Gulf Intracoastal Waterway, the commonly navigated reaches of the Myakka and Peace Rivers, and most Charlotte Harbor bay waters are considered “deep, open water.” The location of what is considered deep, open water also can be associated with the aggregated draft characteristics of a trafficshed or a boating region.

information products, for boaters and shore residents, which encourage environmental awareness by users of neighborhood waterways and boat access channels.

Results from the pilot study Sarasota and Manatee counties (Antonini et al., 1998; Swett et al., 1999), prompted Lee County to authorize the evaluation of its waterways in three project phases (Swett et al., 2000, Swett et al., 2001, and Fann et al., 2002). Another study addressed additional water bodies in Manatee County (Swett et al., 2002).

3. Information Base

Florida Sea Grant conducted on-the-water surveys in order to document the location and characteristics of boats and moorings (February–July 2008). Coastal Engineering Consultants Inc. provided point soundings from which channels were constructed. This report presents boat and channel information for the Charlotte County project area (Figure 1). Boat and channel characteristics are reported for individual trafficsheds and secondary channels that provide access for boats from two or more trafficsheds.

The following presents a general overview of key site conditions.

- a. **Trafficsheds.** The study identifies 155 trafficsheds in the Charlotte County project area. Table 1 and Figure 2 present summary and regional data on the distribution of boats, and Appendix C provides details for each trafficshed and secondary channel system.
- b. **Boats.** The boat census observed 10,613 boats berthed on water bodies or stored on salt-water accessible parcels. Boat were logged as cruising sail, day sailor, excursion, fishing sport, gambling, houseboat, jet ski (personal watercraft), kayak/row/canoe, market fish, none, other, power cabin, racing sail, speed, trawler, or utility/bass/skiff/john/pontoon. Table 2 aggregates these types into eight categories. The characteristics collected for each boat include: facility, mooring type, length, age (to decade), make and model, draft (to 0.5 foot), draft adjustment capability, and the date the boat was observed.
- c. **Moorings.** The region includes 31,673 moorings, which are defined as boat locations that are either occupied (10,613) or vacant (21,060). Mooring types are reported as anchorage, beached or blocked, davits, dry stack, “float/ramp” (usually for personal watercraft), hoist, mooring, ramp, seawall, trailer, and wet slip.

4. Field Surveys

- a. **Boats and Moorings.** The positions and attributes of boat and waterway features were surveyed using Tripod Data Systems (TDS) Recon handheld computers running TDS Solo Field software and equipped with Holux GM-270 GPS receivers. Advantage range finders (Laser Atlanta Optics, Inc.) determined the offset from the observer's location to the position of the surveyed feature.

b. **Depths.** Coastal Engineering Consultants, Inc. (CEC), Naples, FL, provided the bathymetric data (point soundings) from which Florida Sea Grant constructed channels for the analysis. CEC evaluated ArcGIS shapefiles of Charlotte County waterways, prepared by Florida Sea Grant, against the available Charlotte County Public Works bathymetric data sets. CEC was tasked to identify areas of missing data and to conduct additional bathymetric surveys as necessary.

Charlotte County Public Works (CCPW) bathymetric survey data collected between 2002 and 2006 and CEC bathymetric survey data obtained between 2007 and 2011 were the basis of the county-wide bathymetry.

The survey vessel that CEC used for this work was an 18-foot fiberglass hull powered by an outboard motor and equipped with an Innerspace 456 depth sounder with a side-mounted transducer. The GPS antenna utilized the same side mount bracket as the transducer to place it directly above the transducer. A Leica GPS SR530 series rover unit was integrated with the on-board computer system. The Hypack 2008, or newer, software package was the hydrographic guidance program.

All survey equipment was properly calibrated and operated in accordance with DEP standards. Bar checks to calibrate the fathometer were performed daily for verification of accuracy. A direct depth measurement check was conducted and recorded at both shallow and maximum depths relative to the work area. Latency checks were conducted each day. Latency on the order of 0.2 to 0.5 second was experienced using the GPS system. The latency corrections were calculated and adjustments were made to the data using the Hypack subroutines. Bathymetric survey data collection was conducted in calm seas. Maximum wave heights during the data collection period were less than 2 feet. The data was collected at intervals not exceeding 25 feet and at all grade breaks along the profile sufficient to accurately describe the bathymetry at the profile locations.

5. Analysis

Channel Restrictions, defined as the difference between a channel segment depth and the maximum draft of vessels located up-channel, and portrayed in five restriction classes: no restriction (< 0 ft), somewhat restricted (0.0 ft or 0.5 ft), restricted (1.0 ft or 1.5 ft), severely restricted (2.0 ft or 2.5 ft), and blocked (>2.5 ft); and *Boat Restrictions*, defined as the difference between boat draft and the controlling center-line depth and portrayed in five restriction classes (same units as Channel Restrictions).

6. Geographic Information System (GIS) Data Files, Metadata, and Software Application

Deliverables of this project include GIS data files and corresponding metadata. The GIS database includes boats, moorings, boating access channels (including segment depths to 0.5 foot MLLW), and trafficsheds. They have been provided to the

county on a CD-ROM as ESRI shapefiles and an ESRI geodatabase. The provided metadata is consistent with federal standards.

7. Institutional Framework for Regional Waterway Systems Management

The WCIND met with the FDEP Deputy Secretaries in September 1997 and discussed the state's adoption of the waterway management methodology described in this report. The FDEP, at that meeting, signed a Memorandum of Agreement (MOA), wherein the agency states that it will work as a partner with FSG and the WCIND in implementing a regional waterway management system in WCIND waters. Charlotte County is well positioned to implement the study's results by proposing to the FDEP an ecosystems-type approach to waterway management, including needed maintenance dredging, habitat restoration, and boat traffic management.

8. Results of the Charlotte County Project

a. Boats

The Charlotte County project area contains 10,613 surveyed small-craft vessels, which are in the water or on adjacent tidal-water accessible upland parcels (Table 2). Predominant vessel types were recreational fishing (39.9 percent), open utility (19.6 percent), power cruisers/trawler yachts with cabin (14.1 percent), and sailboats (11.1 percent). Relatively few personal water craft (3.1 percent) are at waterfront locations.

b. Trafficsheds

The term *trafficshed* is used to define an area that contains a concentration of boats that use a common channel, exclusive to the trafficshed, to gain access to deep, open water. This term refers to a unit of segmentation that was created to facilitate waterway management objectives. Segmentation into trafficsheds permits data generalization and reduction for GIS analysis and subsequent management recommendations.

The Charlotte County project area includes 155 defined trafficsheds. (Figures 3 through 6 are maps that show the location of each trafficshed.) Almost all boats (10,274) are located in trafficsheds and 169 were surveyed along secondary channels. The other 170 vessels are in locations directly accessing the Gulf Intracoastal Waterway channel or other "deep, open water" in this project (Table 1 and Figure 2). Approximately 65 percent of all restricted boats are situated in trafficsheds that contain 100 or more boats.

c. Accessibility

Boat accessibility refers to the difference between a boat's draft and the MLLW depth of the shallowest downstream channel segment that the boat must traverse to gain access to a secondary channel and, ultimately, deep water— the point at which a vessel is no longer restricted to a channel. Five levels of restrictions are denoted:

- (a) Not restricted (boat draft less than channel depth)
- (b) Somewhat restricted (0.0 ft or 0.5 ft deeper).
- (c) Restricted (1.0 ft or 1.5 ft deeper).
- (d) Severely restricted (2.0 ft or 2.5 ft deeper).
- (e) Blocked (3.0 ft or more deeper).

Twenty-five percent of all boats (2,628 of 10,613) experience some degree of restriction. Of the restricted boats, 1,801 (68.5 percent) are somewhat restricted and only experience problems within 0.5 ft of MLLW; 596 boats (22.7 percent) are restricted by 1.0 - 1.5 ft; 161 (6.1 percent) are severely restricted by 2.0 - 2.5 ft; and 70 (2.7 percent) are blocked by shoals \geq 3.0 feet. A summary of the analytical results is presented in Table 3. Figure 7 shows a sample of the results displayed in a geographic information system (GIS).

The boats in the study area may be grouped into three draft categories: shallow (0.5 to 1.5 ft), medium (2.0 to 3.5 ft), and deeper draft (4.0 ft and greater). Thirty-three percent (3,529) of all boats have shallow drafts, 55 percent (5,881) have medium drafts, and 11 percent (1,203) have deeper drafts. Of all 2,628 restricted boats, 14 percent have shallow drafts, 61 percent have medium drafts, and 25 percent have deeper drafts (Table 4).

Some boats—those propelled by outboards or inboards with out-drives—are capable of varying their draft by partially raising or lowering the outboard unit of the propulsion system. The accessibility analysis for these boats included two options: (a) normal running conditions, with the lower unit fully extended; and (b) shallow water running, with the lower unit partially raised, for temporary shoal operation. Seventy percent (1,837) of the restricted boats have the ability to raise their lower units (Table 5). These are concentrated at the lower end of the restriction levels, meaning that raising the lower unit by 0.5 -1.0 ft would effectively eliminate, or substantially reduce, the restriction problem. A substantial majority (83 percent) of the restricted boats with "variable draft" capability are in the 1.5 ft (300), 2.0 ft (553), 2.5 ft (451), and 3.0 ft (233) draft categories (Table 6).

d. Spatial Distribution of Restricted Access Boats

Twenty trafficsheds, each with 35 or more restricted boats, account for almost three-fourths (72.4 percent) of all 2,628 restricted boats (Appendix A). The 22 trafficsheds are (number of restricted boats at MLLW listed in parentheses): South Gulf Cove (388), Punta Gorda Isles-Pompano Inlet (232), Ainger Creek (203), Punta Gorda Isles-Ponce Park Inlet (111), Apollo-Jupiter-Inglesol Waterway (107), Burnt Store Golf & Racquet Club (98), Oyster Creek (89), Sunrise Waterway (87), Ackerman Waterway System (86), Manasota-Central (63), Elkcam Waterway Systems (54), Punta Gorda Marina (54), Riviera Marina (52), Bay Waterway (44), Alligator Creek-South Fork (44), Cheshire Waterway (43), Pirate Harbor (39), Manasota-North (37), Canal Waterway (36), and Punta Gorda Isles-Tarpon Inlet (35).

An additional 11 trafficsheds, each with 20 or more restricted boats, account for another 11 percent of all restricted boats: Cleveland (34), Kettle Harbor (30), Countryman Waterway System (30), Punta Gorda Isles-Bass Inlet (30), Venice Canal (29), Baldwin Waterway (26), El Jobean (25), Bocilla Inlet (24), Gottfried Creek (22), Cape Haze Canal (20), and Broad Creek (20).

Eighty-three percent of all restricted boats are situated in these 31 trafficsheds; the relative proportions of restricted boats at these trafficsheds are shown by graduated dots in Figure 8.

e. Channel Restrictions

Coastal Engineering Consultants, Inc. (CEC) provided 294,975 soundings, corrected to MLLW, along approximately 350 statute miles of Charlotte County waterways. Using points selected from this dataset, Florida Sea Grant constructed channel segments for travel routes that were analyzed to determine the location and extent of restrictions (shoals) that impede boat traffic.

To determine the degree to which a channel might impede upstream boat traffic, the MLLW depth of each channel segment was compared to the *deepest draft boat located “upstream.”* Table 7 summarizes the channel restrictions. A sample of the mapped results is shown in Figure 7.

Boat traffic is restricted on approximately 20 percent (68.7 mi.) of the principal travel route waterways. However, 46 percent of the restricted channel length (31.4 mi.) impedes vessel transit only by less than or equal to 0.5 feet at MLLW. The remaining 54 percent of restricted channel length consists of 17.4 mi. that restrict by 1.0 or 1.5 ft, 7.4 mi. that restrict by 2.0 to 2.5 ft, and 12.5 mi. that restrict by 3 ft or greater at MLLW (Table 7 and Figure 9).

Fifty-seven percent of the restricted channel length (38.9 miles) is found in the 20 trafficsheds that contain approximately three-fourths of all restricted boats (see **7d**).

Spatial Distribution of Restricted Boats and Appendix B). The sums of restricted channel lengths (in miles) are: South Gulf Cove (13.26), Punta Gorda Isles-Pompano Inlet (2.22), Ainger Creek (2.30), Punta Gorda Isles-Ponce Park Inlet (1.26), Apollo-Jupiter-Ingersol Waterway (0.89), Burnt Store Golf & Racquet Club (1.16), Oyster Creek (2.16), Sunrise Waterway (0.51), Ackerman Waterway System (5.30), Manasota-Central (0.52), Elkcam Waterway Systems (1.54), Punta Gorda Marina (0.67), Riviera Marina (0.06), Bay Waterway (0.60), Alligator Creek-South Fork (2.54), Cheshire Waterway (0.42), Pirate Harbor (0.79), Manasota-North (0.79), Canal Waterway (1.27), and Punta Gorda Isles-Tarpon Inlet (0.63). (**Important:** These restricted channel length totals do not include restricting segments in secondary channels “downstream” from some trafficsheds. For instance, the Windmill Village Canals trafficshed, which feeds into Alligator Creek, contains 7 boats with some degree of restriction but has no restricting channel segments within its boundary. Rather, channel segments in the Alligator Creek Secondary Channel restrict the Windmill Village boats.

The additional 11 trafficsheds with 20 or more restricted boats contain 7.4 percent (5.09 miles) of all restricted channels (see **7d. Spatial Distribution of Restricted Boats**). The sums of restricted channel lengths (in miles) for these trafficsheds are: Cleveland (0.60), Kettle Harbor (0.47), Countryman Waterway System (0.32), Punta Gorda Isles-Bass Inlet (0.32), Venice Canal (0.31), Baldwin Waterway (0.89), El Jobean (1.18), Bocilla Inlet (0.46), Gottfried Creek (0.22), Cape Haze Canal (0.03), and Broad Creek (0.28).

f. Projected Dredging Requirements

Dredging requirements are projected for all trafficsheds (Appendix C). Estimates are based on a 20-foot wide improvement footprint, which conforms with the WCIND “surgical” approach to maintenance dredging adopted for regional waterway management in southwest Florida in order to minimize environmental impacts to bay resources. This improvement footprint, along with the 5 ft margin setbacks for channel markers, is consistent with the WCIND standard of 30 ft wide navigation channels.

Tables 8 and 9 present an analysis for all trafficshed channels and secondary channels in the study region. The ratio of Total Dredge (Tables 8 and 9, right-hand column) to Restricted Boats (Tables 8 and 9, third column) gives a lumped per-boat dredge volume that is applicable within the trafficshed or secondary channel. For example, under the Normal Clearance option (Table 8), Manasota-North, with 37 restricted boats and an estimated total dredge of 7,591 yd³, would have a per-boat dredge requirement of approximately 205 yd³, whereas Manasota-Central would have an approximate per-boat dredge value of 22 yd³. This ratio is an aggregated value and may be expected to vary within a trafficshed, since restricted boats and channel segments are spatially distributed.

Estimates of required dredging were calculated using two scenarios:

- i) Normal (MLLW = 0 ft datum) Depth Clearance (Table 8); and

- ii) Additional Depth Clearance, which requires a 1 ft clearance between lowest point of boat and channel bottom (Table 9).³ Dredging amounts are in cubic yards and assume a base channel width⁴ of 20 ft.

Under Scenario (i) Normal Clearance, the amount of dredge required for a 100-ft channel segment restricted by 1.5 ft, is equal to the restriction amount, multiplied by a 20-ft base channel width, divided by 27 (27 ft³ per yd³), or approximately 111 cubic yards.

$$[100 \text{ ft} \times 1.5 \text{ ft} \times 20 \text{ ft}] / 27 \text{ ft}^3 \text{ per yd}^3$$

Given the above assumptions, the depth of dredge equals the restriction level of the channel, e.g., a channel with a 2.5 restriction level would require a 2.5 ft depth cut.

Under Scenario (ii) Additional Depth Clearance, the same obstruction would require approximately 185 cubic yards:

$$[100 \text{ ft} \times (1.5 \text{ ft} + 1.0 \text{ ft}) \times 20 \text{ ft}] / 27 \text{ ft}^3 \text{ per yd}^3$$

In this case, restricted channel segments would be dredged to the restriction level plus an additional foot, e.g., a somewhat restricted segment (0.5 ft restriction) would be dredged to $0.5 + 1.0 = 1.5$ ft.

A comparison of the results between Normal (approximately 349,712 yd³) and Additional (approximately 658,454 yd³) shows that approximately 1.9 times the amount of spoil would need to be removed, overall, to achieve the additional depth clearance. The top 20 trafficsheds (by number of restricted boats: 35 or more), which, combined, contain 72.4 percent of all restricted boats, represent 70 percent of the estimated Normal dredging needs for the county. Figure 10 shows the locations of these trafficsheds, which are represented on the map by graduated-size dots. Two-thirds of the total estimated dredge volume is within the South Gulf Cove Waterway-South Gulf Cove trafficshed, which contains 53 miles of waterway with approximately 13.26 miles of restricted segments.

³This may be considered an extended application of the FDEP Rule for Aquatic Preserve Waters, which requires, in non-man-made canals or previously un-dredged portions of coastal streams, a 1 ft clearance at the dock between the lowest point of the boat hull or fixed drive unit (whichever is lower) and any submerged bottom lands or tops of sea grasses.

⁴There is great variation in channel width within the canals and waterways of Charlotte County. To account for the variation, a base channel width of 20 feet was used to calculate estimated dredge volumes for all restricted channel segments. This 20-foot base channel width, or improvement footprint, will accommodate the majority of recreational boats when two pass abreast of each other. There are locations, however, when a restricted channel will require either a width greater than 20 feet or can only accommodate a narrower width. To determine an estimated dredge volume that accounts for a wider or narrower channel, simply multiply the estimated dredge volumes contained in the report by the ratio of the required width and the base channel width. For instance, to adjust estimated dredge volumes to account for a required dredge width of 30 feet, multiply the estimated dredge volume within the report by a factor of 1.5 (30 feet / 20 feet). Conversely, to adjust for a 15 ft channel, use a factor of 0.75

g. Relation of Boat Accessibility to Channel Restriction

As stated in section d and f, above, 20 trafficsheds contain 72.4 percent of all restricted boats and 70 percent of the projected Normal Clearance dredge volume for all restricted channels.⁵ Except for the South Gulf Cove Waterway-South Gulf Cove trafficshed, the boat-channel relations for these locations are shown in Figure 11. The South Gulf Cove Waterway-South Gulf Cove trafficshed is not shown since it contains 44 percent of the estimated dredge volume for the county and 15 percent of the restricted boats. Importantly, many of the deepest-draft boats surveyed in South Gulf Cove were on land ("beached/blocked") at Charlotte Harbor Boat Storage, a large yard at the southwest corner of the trafficshed, far from the trafficshed's entrance on the Myakka River. Of 134 boats in the yard when field crews visited, 63 had draft of 4.5 to 6 feet. According to yard personnel, "almost all" vessels using the yard arrive and depart via the waterways, rather than by road. (For trafficshed-specific information on restricted boat counts and channel lengths (ft), see Appendixes A and B).

9. Special Management Considerations Warranted in the Charlotte Harbor Vicinity

Essential to Florida's distinctive character is the rich bounty of its coasts, which sustained the earliest inhabitants and attracts today's tourists and residents. Ironically, the pressures that result from increasing population endanger the very features that draw people to Florida.

In 1975, Florida passed the Aquatic Preserve Act to protect its living waters and to ensure that they are home forever to bird rookeries and fish nurseries, freshwater springs and salt marshes, and seagrass meadows and mangrove forests. Today, Florida has 41 aquatic preserves encompassing nearly two million acres, five of which are within the greater Charlotte Harbor estuary complex: they are *Lemon Bay*, *Cape Haze*, *Gasparilla Sound–Charlotte Harbor*, *Matlacha Pass*, and *Pine Island Sound* (Figure 12).

In the late 1970's, the state began acquiring lands around Charlotte Harbor to create the *Charlotte Harbor State Preserve* as an upland "buffer" to protect the aquatic resources. The park was later renamed Charlotte Harbor State Buffer Preserve and then, in 2004, it became the Charlotte Harbor Preserve State Park. By preserving upland habitats surrounding the aquatic preserves, the park helps protect water quality, sea grasses, and other habitats that are important to fish and wildlife.

As part of the Department of Environmental Protection's system of Aquatic and State Buffer Preserves, a stringent water quality classification, as identified in section 62-302.700 of the Florida Administrative Codes, governs all activities within the Pine Island Sound Aquatic Preserve. The aquatic preserve status is designed to promote conservation-oriented use. Permission may be authorized by the state regulatory agency (FDEP), on a case-by-case basis, to carry out water-dependent activities that

⁵ As previously stated, it is important to note that boats within a trafficshed also may be restricted by depths along any secondary channels that need to be traversed after exiting a trafficshed.

must have access to sovereign lands and waters, because the activity requires it (e.g., recreation, transportation) and where the use of state land or water is an integral part of the activity. Examples of such cases include: public navigation projects, maintaining existing navigation channels; creating and maintaining commercial or industrial docks, piers, or marinas; creating or maintaining private docks for water access by riparian owners; and maintenance dredging for navigation right-of-way to docks.

A rational management policy for regulating public waterways must balance the needs of users with a careful consideration of natural resources and environmental limitations. An adequate and effective policy will require detailed information, such as boater characteristics or manatee use, in order to make sound management decisions.

10. Conclusions and Recommendations

The waterway management needs of Charlotte County are uniquely defined by the geography of boat source areas (trafficsheds) and the secondary channels that service the trafficsheds; there are waterways with many boats and areas with few boats. The relations of boat draft to controlling channel depth determine the degree of boat accessibility and channel restrictions. An understanding of these relations is fundamental to developing and implementing rational waterway management policy. The results of this study argue in favor of prioritizing channel improvements based on greatest need; they also highlight conditions within county waters that should guide region-wide bay water use policies. A rational waterway planning policy must address both user needs and environmental limitations.

a. Short-term

1. Study results indicate that the greatest problems of boat access and channel restrictions occur in a relatively few trafficsheds. The trafficsheds that contain the greatest numbers of restricted boats are: South Gulf Cove, Punta Gorda Isles-Pompano Inlet, Ainger Creek, Punta Gorda Isles-Ponce Park Inlet, Apollo-Jupiter-Ingersol Waterway, Burnt Store Golf & Racquet Club, Oyster Creek, Sunrise Waterway, Ackerman Waterway System, Manasota-Central, Punta Gorda Marina, Elkcam Waterway Systems, Riviera Marina, Alligator Creek-South Fork, Bay Waterway, Cheshire Waterway, Pirate Harbor, Manasota-North, Canal Waterway, and Punta Gorda Isles-Tarpon Inlet.

These 20 trafficsheds account for nearly three-fourths of the boat access problems and 57 percent of restricted channels. Charlotte County should concentrate initial waterway management efforts at these locations.

An additional eleven trafficsheds, each with 20 or more restricted boats, account for 11 percent of all restricted boats and 7.4 percent of channel restrictions: Cleveland, Punta Gorda Isles-Bass Inlet, Countryman Waterway System, Kettle Harbor, Venice Canal, Baldwin Waterway, El Jobean, Bocilla Inlet, Gottfried Creek, Broad Creek, and Cape Haze Canal.

2. The waterway inventory information in the project's GIS database has value and application beyond the bay water planning and management results presented in this report. This information should be reformatted and provided to shoreline residents and boaters in the trafficsheds targeted for waterway improvements, as Waterway Maps, showing channel center-line depths, boat facilities, and natural resource conditions. (The WCIND and FSG have produced similar maps of anchorages.) This information can sensitize users to the environmental conditions of the waterways and provide a basis for instilling stewardship and responsible boating practices.

3. Charlotte County should consider implementing these recommendations under the Memorandum of Agreements (MOAs) that WCIND has in place with the FDEP. The MOAs are designed to offer local governments and local waterfront community organizations a mechanism to effect regional waterway improvements within an ecosystem, place-based management approach. The MOAs provide an avenue for pursuing region-wide permit review and project applications. A proposal should be submitted to the FDEP that is countywide in coverage and comprehensive in scope.

b. Long-term

4. Charlotte County and the WCIND have an investment in this Regional Waterway Management System. This system should be maintained and enhanced in order to respond to the county's growing needs for rapid assessment and comprehensive geographic analysis of its bay water resources.

5. The Regional Waterway Management System can be strengthened by linkage to the county's upland databases, which will facilitate response to more complex issues that transcend land-water boundaries. For example, sediment sources could be identified and their relative contribution to waterway shoaling quantified. This would allow for a more equitable distribution of maintenance dredging costs among those charged with waterway maintenance and those who contribute to shoaling.

6. The Regional Waterway Management System database should be updated periodically with countywide boat information.

7. The bathymetric surveys should be updated, as needed, to identify shoaling conditions of the waterways.

8. An appropriate county department with the GIS equipment, software, and training should carry out ongoing waterway inventory and analysis, in order to respond to routine customer requests for information and technical services. The Florida Cooperative Extension Service and State University System should continue to provide institutional and professional support.

9. A measure of the success of the regional waterway management program is whether technical results are translated into meaningful benefits for local communities. A program that includes a strong boater education component will best address the diverse management needs of Charlotte County. The Charlotte County Marine Agent, an extension education position, is a timely resource for the dissemination of Project results at the local, community level. The Marine Agent can work with interested waterfront communities to help maintain their waterways, providing assistance in the

form of project data, technical support, workshops, and field site inspections. Networking the community with permitting agencies and contractors, in order to develop community-based strategies to restore and maintain waterway resources, will increase the effectiveness of the Marine Agent. Boaters can play an active, critical role in determining whether to boat in a given area, what type of boating should occur, and what level of intervention is necessary.

Table 1. Distribution of boats logged by trafficshed type for Charlotte County.

Trafficshed Type	Trafficshed Count	Percent	Boat Count	Percent*
0 Boats logged	9	5.8%	0	0%
2 to 10 Boats	49	31.6%	274	2.7%
>10 to 100 Boats	76	49.0%	2,393	23.3%
>100 to 500 Boats	15	9.7%	2,901	28.3%
>500 Boats	6	3.9%	4,701	45.8%
Totals	155	100%	10,269	100%

*Note: Of 10,613 boats surveyed in Charlotte County waters, 10,269 were in trafficsheds and 243 were along secondary channels. The other 101 — surveyed in open water, along shorelines, etc. — are excluded from the analyses.

Table 2. Counts of boat types for Charlotte County.

Boat Type	Count	Percent
Recreational Fishing	4,236	39.9%
Open Utility*	2,077	19.6%
Power Cabin/Trawler	1,493	14.1%
Sail	1,180	11.1%
Speed	594	5.6%
Kayak/Row/Canoe	578	5.4%
Personal Water Craft	329	3.1%
Other**	126	1.2%
Totals:	10,613	100.0%

*Open utility/bass/skiff/john/pontoon or deckboat

**Includes Excursion, Houseboat, and Market Fish, as well as "None" or "Other" (not determined).

Table 3. Boat access levels for Charlotte County.

Access Level	Boats	Column Percent
All Boats	10,613	100%
Unrestricted Boats	7,985	75%
Restricted Boats	2,628	25%
Somewhat Restricted	1,801	68.5%
Restricted	596	22.7%
Severely Restricted	161	6.1%
Blocked	70	2.7%

Boat access levels refer to the difference between a boat's draft and the depth (MLLW) of the shallowest, downstream channel segment:

Somewhat Restricted: 0.0 feet or 0.5 feet deeper.

Restricted: 1.0 feet or 1.5 feet deeper.

Severely Restricted: 2.0 feet or 2.5 feet deeper.

Blocked: 3.0 feet or more deeper.

Table 4. Number of restricted boats and levels of access by boat draft category for Charlotte County.

Draft Category	Restricted Boats*	Column Percent
Shallow	363	14%
Medium	1,595	61%
Deeper	670	25%
Total	2,628	100%

Shallow: 0.5 to 1.5 feet

Medium: 2.0 to 3.5 feet

Deeper: 4.0 feet and greater

*The 2,628 boats with some level of restriction (Table 3)

Table 5. Variable draft capability of restricted boats for Charlotte County.

Restriction Level	Boats	Variable Draft		Percent Boats Variable Draft
		Yes	No	
Somewhat Restricted	1,801	1,424	377	79%
Restricted	596	338	258	57%
Severely Restricted	161	56	105	35%
Blocked	70	19	51	27%
Total Restricted Boats	2,628	1,837	791	70%
Percent of Column Total	100%	70%	30%	

Table 6. Variable draft capability by boat draft for restricted boats in Charlotte County.

Draft (feet)	Boats	Variable Draft		Row Percent
		Yes	No	
0.5	13	0	13	0%
1.0	44	36	8	82%
1.5	306	300	6	98%
2.0	564	553	11	98%
2.5	491	451	40	92%
3.0	327	233	94	71%
3.5	213	97	116	46%
4.0	233	82	151	35%
4.5	141	24	117	17%
5.0	162	23	139	14%
5.5	64	13	51	20%
6.0	39	18	21	46%
> 6.0	31	7	24	23%
Total	2,628	1,837	791	70%

Note: Row and column percentages are based on the number of restricted boats with variable draft capabilities.

Table 7. Channel restrictions for Charlotte County.

Restriction Level	Length (feet)	Length (miles)	Column Percent	Percent of Total ¹
All Channels	1,848,245	350.1	100%	100%
Unrestricting Channels	1,485,547	281.4	80%	80%
Restricting Channels	362,698	68.7	20%	20%
Somewhat Restricting	165,844	31.4	46%	9%
Restricting	92,003	17.4	25%	5%
Severely Restricting	38,883	7.4	11%	2%
Blocking	65,968	12.5	18%	4%

¹Percentage of the total length of all channels in the study area (350 miles).

Restriction Level Refers to the difference between a channel segment depth (MLLW) and the deepest draft boat located upstream from the segment:

Somewhat Restricting: 0.0 feet or 0.5 feet shallower.

Restricting: 1.0 feet or 1.5 feet shallower.

Severely Restricting: 2.0 feet or 2.5 feet shallower.

Blocking: 3.0 feet or more shallower.
